

ANDROCHI

Description

Androchi is the artificial intelligence - software for the Android - based mobile devices.

The name and idea were developed from small Japanese toy called Tamagotchi.

Androchi is a pet- like character which eats, learns, gets seek and so on. User must train it and keep it satisfied.

- SQLite
- Basic inheritance in classes

How does it work...

Adrochi is spending out vitality, strenght, satisfaction and sated - resources from db in a Random time.

User folows the indicators and gives Androchi some food or gives him a book to read until indicators start to increase.

Mainly user keeps his Androchi satisfied.

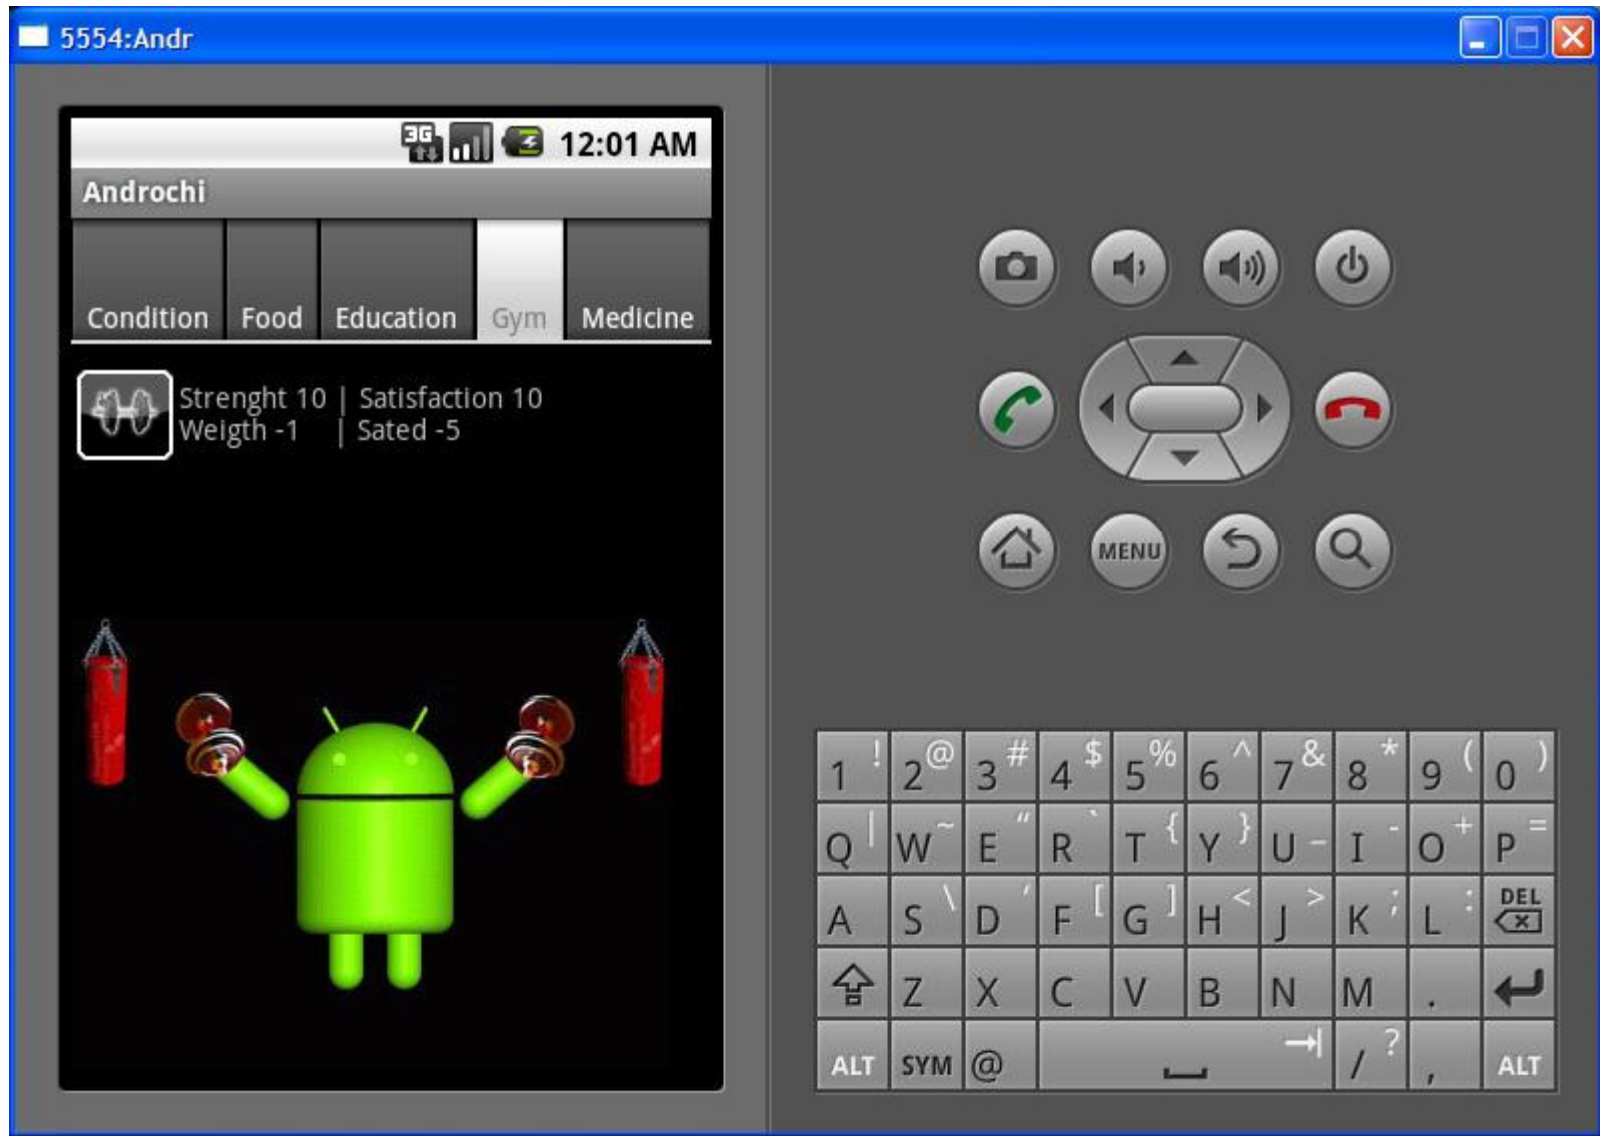

Condition statistics

Food list

Gym practice

Further development...

Androchi could evolve to online pet and meet other Androchis online or you can see another Androchi in Google maps real time.

It's possible to buy food, books, drugs and gym praticies online.

It's possible to add some ambient music and sound effects to every animation.

What we learned...

Android SDK brings, for sure, extra aspects to Java. But on the other hand Google brought us a powerful tool for its mobile device which has much more opportunities to customize everything than previously familiar J2ME for Symbian mobile devices.

Things we learned:

- Basic programming for Android
- SQLite programming.
