

# TeamNullPointerException

## --GPS Tracker--

- Tracker application that use wlan and GPS to position device
- Should have pointed the user on a map but python didn't have good funtions to draw image over another image
  - Coded using python 2.5 (pymaemo)

# Main view

# What we managed to do?

- GPS works and gives us coordinates
- User interface
- We can print those coordinates out to user interface
- Text alarm when boss is getting close (measures to know boss location)

# What was left outside?

- Different phones won't communicate with each other
- Can't draw positions to the map

# Difficulties

- Maemo didn't have good functions to draw images over images
- Layout was quite tricky (still not what we wanted)
- GPS was hard to debug because connections to satellites can't be made inside
- Scratchbox wasn't all too useful
